AN INCH CONTAINS A DOSE

This Plan Is Applicable to Nearly All Needed Remedies, Says London Doctor Who Suggests It.

Dr. W. P. Townsend, obstetrical physician at St. Mary's Hospital, and a member of the surgical staff of the London Hospital, advocates a plan for the preservation and administration of medicines that is so simple that it could be carried out by any nurse in a hospital.

The plan is based on the principle that medicine is a drug which may be administered in a concentration of one grain or less, and that, if properly prepared, it is possible to contain the necessary amount of medicine in a single capsule or pill.

"The principle is simple," said Dr. Townsend, "but it has not been widely used because of the difficulty of preparing the medicine in a suitable form. However, by using a small amount of medicine, it is possible to avoid the necessity of preparing a large quantity of medicine, which is often the case with large doses of medicine.

"The plan is simple to carry out," he continued, "and it can be used in any hospital where it is necessary to preserve medicine in a concentrated form. It is especially useful in hospitals where large quantities of medicine are required, as it is possible to prepare the medicine in a concentrated form and to store it in a small bottle, which can be easily carried by the nurse.
