

# WIRELESS TO RULE OUR LIVES, BRITISH PROFESSOR PREDICTS

LONDON.

**A** FANTASTIC picture of a world run by wireless in the year 2025 A. D. is painted by Professor A. M. Low, noted educator, who predicts that light will be broadcast by wireless, all means of locomotion will be controlled by wireless, and women will at last dress logically in a one-piece hygienic suit, warmed by wireless.

In a book called "The Future" the professor indeed makes the world of a hundred years hence an attractive place in which to live, if simplicity of existence be our aim.

Power for all purposes, always on tap, is the happy aid which the housewives will have to combat the servant question, if one exists then. Wireless will lighten the burden of the business man and also that of the burglar, according to Professor Low. Signatures to checks may be sent by wireless to the bank while the cashier watches by "television." Wireless will be equally helpful to the burglar, who will probably locate hidden valuables by portable radio surveying instruments and other electrical methods.

The average man of 2025 will be awakened by a radio alarm clock. He

will take a few minutes of radio light treatment to keep fit and alert for the business day. Little time will be wasted in putting on his synthetic felt one-piece suit and his hat—the latter being worn almost continuously owing to the fact that baldness will be almost universal then.

At breakfast, which may come up by tube from a communal kitchen, a loud speaker will take the place of a morning paper, giving him all the news, while a "television" machine will replace the daily pictorial newspapers. He will then go to his office in his own car, which will be carried by an elevator to the door of his office. If he has to go anywhere on foot moving sidewalks will convey him without exertion, and automatic telephones will be everywhere and will get the right number all the time.

In the evening when a business man goes to the movies he will see half a dozen films being shown at the same time on the same screen. He will glance at the program and by setting his observation apparatus to the key number of the film he wishes to see, he will cut out all but that one. Then he will go home to his wireless bed, which will make sleep automatic.
